

What the paradox depends on: the measure, the return assumption, and a convention

Countries showing the paradox (of 18), HFCS Wave 5.0.

Measures ordered from those weighting the top (upper rows) to those weighting the bottom (lower rows).

The Gini and the CV give the same verdict under either return assumption.

Lower down, the count turns on how non-positive counterfactual wealth is treated: dropped (filled marks) or kept at one euro (open marks).
